

## **Software testing and quality assurance**

### **Assignment on selenium**

**Robiul Ahammed Sakib**

**Id: 170042058**

#### **Report:**

In this assignment, I used python because I'd some previous knowledge about python selenium. First I downloaded a chrome web driver for chrome version 78, and I got error like this chrome driver only support chrome version 78. Then I downloaded the correct chrome version web driver. I've used duet lms for this assignment, it can click a line from the website which navigate it to login page. Then it fills username and password fields and click login button.

**To run this program**, first we need install selenium using "pip install selenium" command from powershell for windows and check whether it is install using command "pip list". Then we need chrome web driver which supports in existing chrome version. Then using run "Automation.py" file using python and it will automatically run browser and login to the system.
